Agenda

loops & functions

For loop

```
for i in iterator:
    do something
```

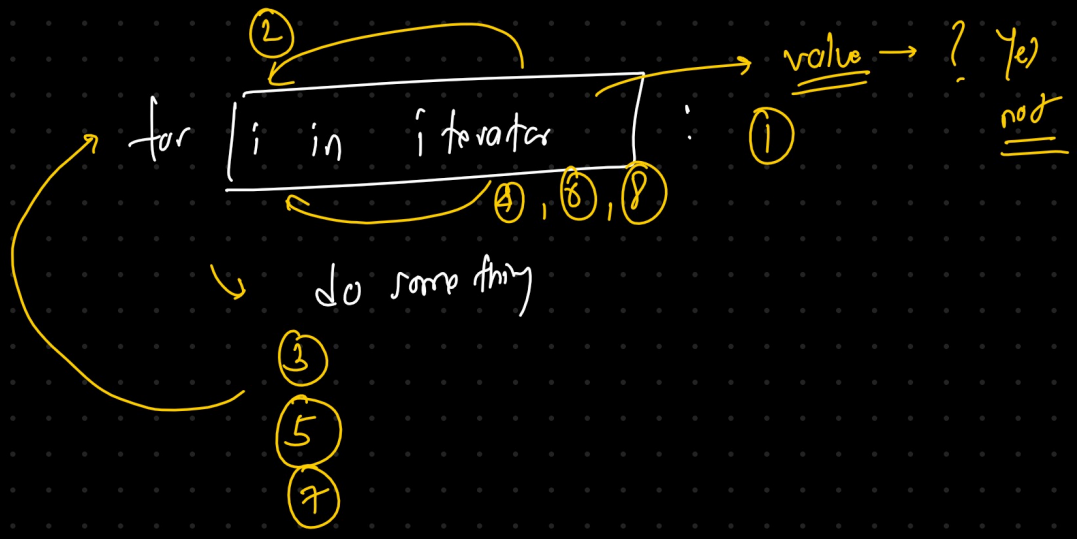

→ limit
→ how many times, to do something?
→ run for 100 rounds.

while:

→ Run until you are tired

→

```
while Condition :
    do something
    condition that while help in stopping
```

while [condition] → True or False

do some thing

condition break out of the loop

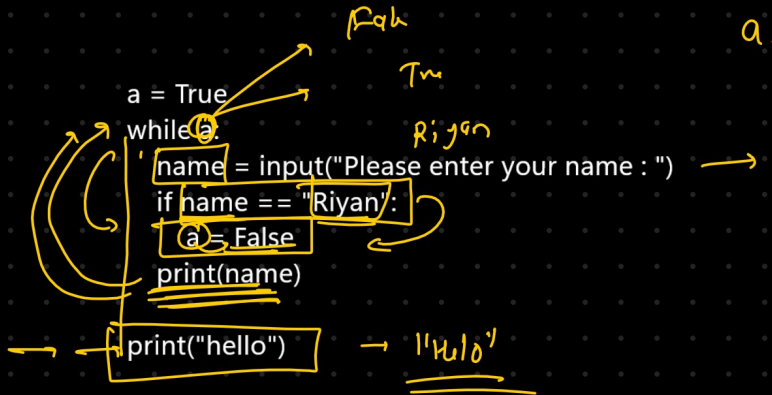

i <= valo

i = va

True

False

=

function

cell →

```
for i in range(0,10):
    print(i)
```

0-9

run again

```
a = int(input())
b = int(input())
print(a+b)
```

→ addition of 2 values

```
def add():

    a = int(input())
    b = int(input())
    print(a+b)
```

function definition

add() → function calling

function parameters :

```
def add(a,b):
    print(a+b)
```

a, b ← add place → cricket

print(a) → X → scope of variable

```
def add(a,b):
    print(a+b)
```

add() → X

default values

```
def add(a=0,b=0):
    print(a+b)
```

add() → 0
add(1,2) → 3
add(1) → X (a, b)

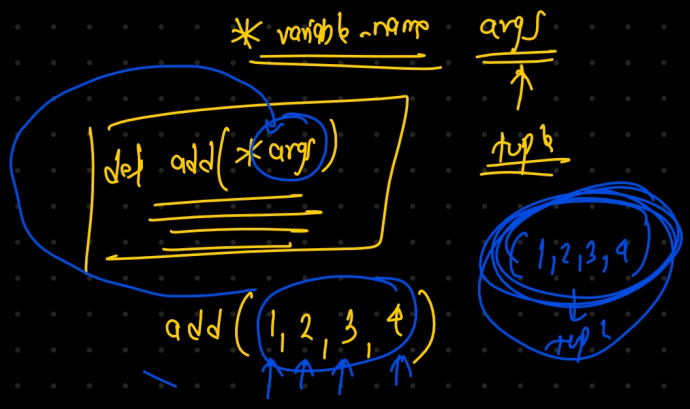

Non-keyword argument

*args → tuple

```
def add_multiple_value(*args):
    sum = 0
    for val in args:
        sum+=val
    print(sum)

add_multiple_value(1,2,3,4,5)
```

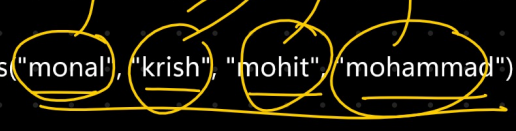

(1,2,3,4)
sum = 0
sum = sum + val
sum = 0 + 1
= 1

w/o *
non-keyword args

```
def get_names(name_1 = "krish", *args):
    for i in args:
        print(i)

get_names("monal", "krish", "mohit", "mohammad")
```

Keyword arguments :

→

*args → tuple

**variable_name → dictionary

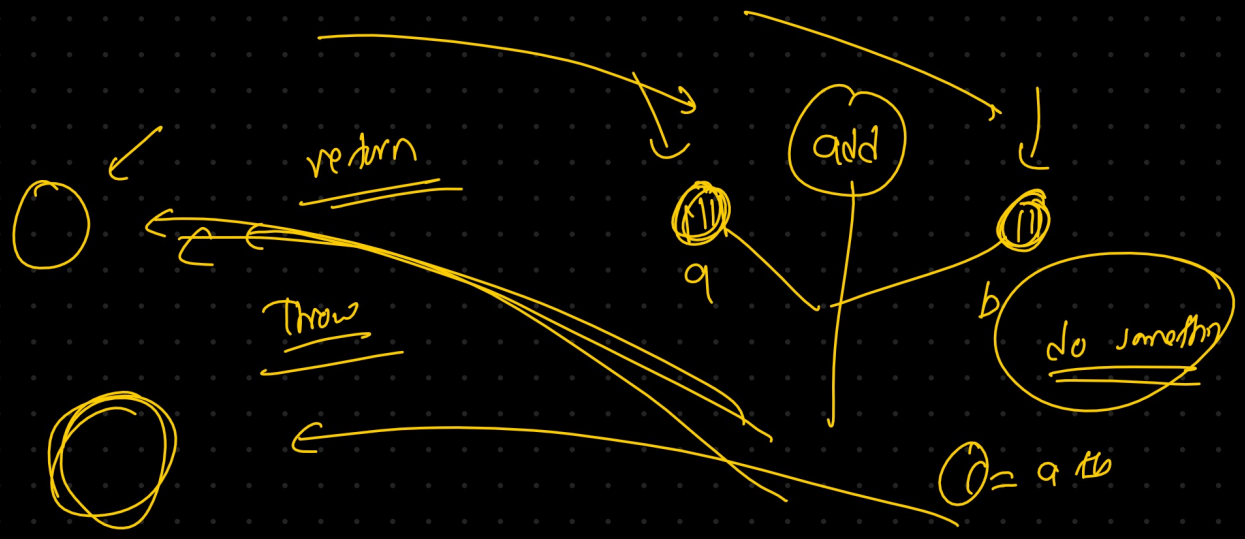

```
def add (a, b, c):
    print(a+b+c)
```

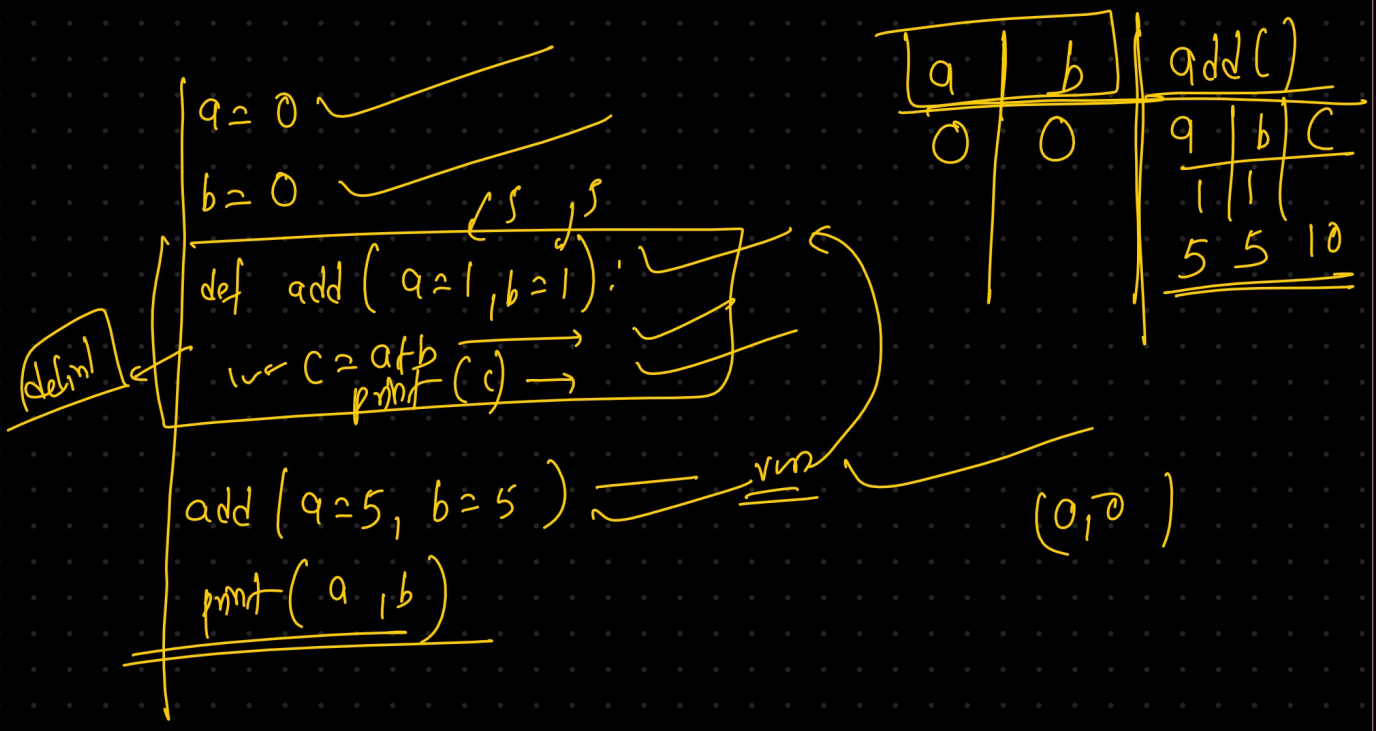

a=1, b=2, c=3

{ a : 1,
  b : 2,
  c : 3 }

kwargs: get("a") → 1

.get("b") → 2

Database

→ patient_first_name, patient_last_name, store (1) date, weight, BI → create_id

→ height, country → dict

→ India → Celcius → temp

non India → Fahrenheit → temp → store (2) BL

patient admission done.

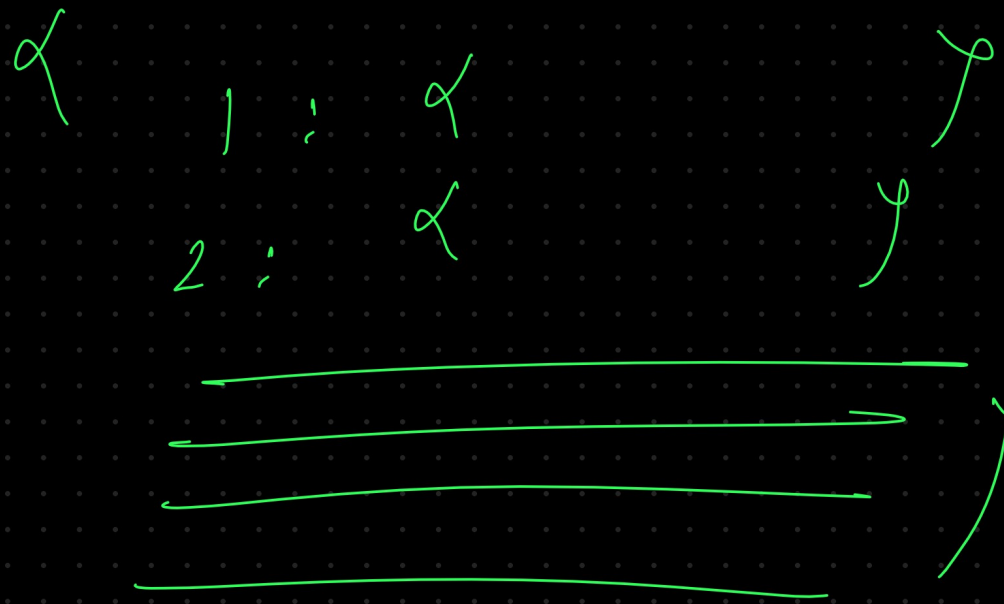

→ get_patient_details_for_opd_use() → store → id

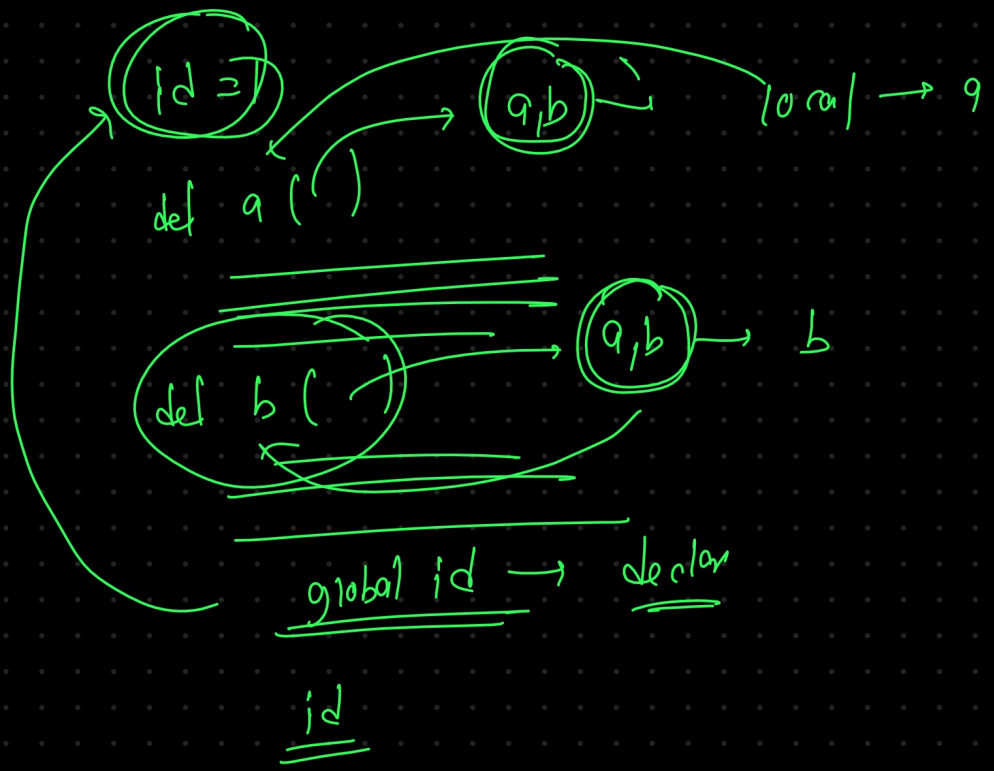

→ patient_full_name, temp_bmi → OPD (3)

func

id =
a,b
local → a
def a ( )
def b ( )
a,b
b
global id → declar
id
